REASON FOR ALLOWANCE

1. Oglivy et al disclose a system for transmitting of information between a track and a vehicle located on the track in a model railroad system using a coil that exists between the vehicle and the track for the transmission of information, and detector means for detecting the information transmitted via said coil. Laurent et al disclose a method of transmitting information through the rails between vehicles and a track comprising at least one capacitor that exists between the rails of the trackway and the vehicle. Takasan et al disclose a system for communication between a fixed station and a carriage comprising a electric power sources and cable extending along the rail. Lwewin et al disclose a rail communication system comprising using track to transmit acoustic signal information. However, none of the references of record suggests a method of transmitting information using at least one capacitor that exists between the vehicle and the track for the transmission of information, wherein the capacitor is formed by surfaces of the vehicle and the track, particular of a wheel of the vehicle and of the track, said surfaces opposing each other by a loss of contact in the manner defined in the instant claims 1, 8, 16 and in combination with other limitations of the claims. Therefore, claims 2-7, 9-15, depending therefrom, are considered to be allowable.
